# GEOLOCATION WITH THE TRIBOX AIR

## COST REDUCTIONS

Thanks to real-time geolocation, follow the positioning of your vehicles, control their activity, identify the nearest vehicle and its driver and be reactive. Geolocation will allow you to increase customer satisfaction and to reduce your administrative and transportation costs.

## PERFORMANCE

Analyse the journey history of each of your vehicles, measure the number of kilometres travelled, calculate downtime and waiting times, check arrival or departure times and calculate your carbon footprint. If necessary, export this data to Excel format.

## AUTONOMY

Be alerted as soon as one of your vehicles enters or leaves an area defined by you, remain vigilant on the safety of your drivers, safely plan the date of the next oil change or technical inspection, simply and autonomously manage access rights to these data.

# GEOLOCATION

## REAL-TIME MONITORING

Thanks to this tool, follow the movements of your vehicles in **real time**. Visualize the positioning of all the vehicles of your fleet in **one click** thanks to a **satellite map** or in **street view**.

In a general table or in a table specific to each vehicle, you will find all the necessary details for an efficient **management of your fleet** (license plate number, driver, status, etc.).

**Determine your POI zones** and be alerted as soon as one of your vehicles enters or leaves these zones and identify the nearest vehicle.

## ACTIVITY REPORTS

For each vehicle, you have a **synthesis** informing you for the selected period (day/week/month) of the daily detail of kilometres travelled, driving times (on the road), stopping times and waiting times.

These activity reports allow you to **track and analyze** the history of your vehicle activity, **streamline** your trips, **simplify** administrative management and **control** your service quality.

**Develop security.** Control your drivers' activity times or their safety thanks to the "**hourly - detailed**" report.
